nudgely↗

Jack's script for the finals

Sat 14 Nov 2026 · 7:00 hard stop, then 5:00 Q&A. You speak 3:00 in five parts; Shareef runs the 4:00 live demo. Speak at about 140 words a minute. Word counts below are the limit, not a target.

0:00–0:20	0:20–0:40	0:40–4:40	4:40–5:40	5:40–6:20	6:20–7:00
Problem	Result	Live demo	How it works	Difference	Next step
Jack · slides 1→2	Jack · slide 3	Shareef · slide 4	Jack · slides 6, 7	Jack · slide 8	Jack · slide 9

1 · Problem

0:00–0:20 · 50 words

SLIDE 1 FOR ONE BREATH · THEN SLIDE 2

> "This is Mei Ling. She runs Kampung Fresh in Tampines. Every Sunday she sends the same '10% off' to all her customers. Hafiz comes every Saturday anyway, so that's margin given away. Aisha asked about oat milk three weeks ago. Nobody remembered. She shops at the supermarket now."

Point at each bubble as you say its name: the blast, Hafiz, Aisha.

2 · Result

0:20–0:40 · 50 words

SLIDE 3

> "Blasting barely works: in a randomised test on 687,000 grocery shoppers, an SMS lifted visits from 10.3% to 11.0%. Mei Ling needs the right message to the right person. We measure one thing: extra return visits per message, against customers who got nothing."

> "Shareef is Mei Ling for the next four minutes."

Say the handover while Shareef walks to the laptop. Never wait in silence. Move to slide 4.

Live demo (Shareef)

0:40–4:40

SLIDE 4 FOR 2 SECONDS · THEN DASHBOARD + AISHA'S WHATSAPP

You don't speak here. Know where he is, so you're ready when he hands back.

0:40	Customers → open Aisha: Persuadable, oat milk and party tags in her own words
1:10	Hafiz is a Sure Thing → 1:25 Campaign skips Hafiz, keeps a comparison group
1:55	Edit a word in Aisha's message, tick, Send on WhatsApp → 2:20 it arrives on her phone
2:30	Aisha asks about oat milk → the AI replies, new tags appear
3:15	Aisha asks for a refund → "Needs a person" → 3:50 STOP → "Opted out" badge
4:20	Shareef: **"Everything you just saw happened live. Jack?"** → slide 6 (the hidden run sheet is skipped)

If something fails, Shareef decides in 5 seconds and Dythan plays the backup video. We always say "this is the recording".
Over time at 4:40? Shareef skips STOP, and you mention opt-out in How it works.

3 · How it works

4:40–5:40 · 140 words across both slides

SLIDE 6

> "Three parts. First, an uplift model. It doesn't ask who might leave; it asks who a message actually changes. It runs on ten things any shop's receipts have. Second, an AI reads each conversation and keeps the details with the customer's exact words as evidence, then drafts the nudge from them. Third, every campaign keeps a no-message group, so the shop sees its own lift."

SLIDE 7, SAID AS A LIST (~25 S)

> "Nothing is sent without a person approving it. Phone numbers are never stored, only scrambled. Names are removed before text reaches the AI. Every reply is checked; if it can't verify a price or stock, or someone asks for a refund, a person takes over. STOP works on every channel. And a daily cap stops runaway AI costs."

4 · Difference

5:40–6:20 · 95 words

SLIDE 8

> "WhatsApp tools like SleekFlow and WATI are great at sending, but you choose who gets what by hand, and you see opens, not extra visits. Enterprise suites like Optimove measure lift, but they're built for big brands with marketing teams. Nudgely is the only one that, for a corner shop, picks who a message changes, writes it from their own words, and proves it worked."

Point at the bottom-left of the grid for the WhatsApp tools, the Optimove cell, then the green Nudgely cell.

5 · Next step

6:20–7:00 · 95 words

SLIDE 9 · QR STAYS UP INTO Q&A

> "Our honest limitation: the evidence is overseas. On a public grocery dataset our top 30% captured 57% of the extra visits, about 1.9 times random, though it ranged from 38 to 85% across tests. A Singapore shop still has to prove it. So the next step is a four-week pilot: one shop, its WhatsApp number, a sales export, and a no-message group. Scan the code and talk to Kampung Fresh yourselves. Thank you."

Stop at 7:00, even mid-sentence. Dythan shows "1:00" at 6:00 and "STOP" at 6:50.

Q&A (5:00): your questions

Answer first in one sentence, then the trade-off. 30–45 seconds each. You take AI, data, the model, measurement and safety; Shareef takes product, flow and the business case. If you're unsure, the other adds one sentence, no more.

Why uplift and not a churn score?

> "Churn says who might leave. Uplift says who a message actually changes. A regular like Hafiz comes anyway, and someone gone for good won't come back whatever you send. Messaging either wastes money. Only uplift skips both."

How accurate is the model?

> "On customers it never saw, our top 30% caught 57% of the extra visits, against 30% at random, about 1.9 times better. It ranged from 38 to 85% across seven tests, because a single SMS only moves visits by about 0.75 of a point. So it's reliable for who to message first, not as an exact number per person, and every campaign measures itself anyway."

Your evidence is Russian grocery data.

> "True, and we say so. Lenta ran a real randomised test on 687,000 shoppers, which is why we can learn what the message itself caused. That's exactly why we're asking for a pilot, not a sale."

What data does it use?

> "The shop's own receipts and chats. The model needs only phone, date and amount, turned into ten numbers like how regular someone's visits are. No age, gender or children, on purpose. Phone numbers are never stored on the chat side; names are removed before the AI."

How do you measure retention?

> "Every campaign holds back a random no-message group. We match the shop's sales to both groups over 30 days and compare return rates. The difference is the lift, shown with the range it could really be."

Does it learn from my shop?

> "It starts from what it learned on public data. Every campaign records who was messaged, who was held back, and who came back. That's exactly what's needed to retrain on the shop's own customers once there are a few hundred."

When does it hand over to a person?

> "Refunds and complaints, when someone types HUMAN, photos or voice notes, anything it can't verify like a price or stock that isn't in the shop's list, and if the daily AI budget runs out."

What if a service fails?

> "The AI falls back to other models; if all of them fail, a person takes over. If WhatsApp is down nothing is sent, and the owner sees it."

Why this segment?

> "Neighbourhood shops already run on WhatsApp but have no marketing team. Their customers are few enough that every wasted or annoying message matters."

Isn't this just SleekFlow or WATI?

> "They send; we decide who and what, and prove it worked. We'd plug into them as the delivery layer."

Why not MantaGO?

> "We started on MantaGO. Its API doesn't share incoming chat text, and its WhatsApp delivery didn't work on our account, so we built on WhatsApp's official API, which is what makes the AI conversation possible. Platforms like MantaGO are natural delivery partners."

What would a pilot need? · What does it cost?

> "One shop, a WhatsApp business number, a four-week sales export, consent wording at signup, and a no-message group. It costs about $0.00025 per AI reply, plus WhatsApp's per-message fee."

Why gradient boosting, not deep learning?

> "It's the standard winner on small tabular data like receipts. Neural uplift models need tens of thousands of outcomes, which a small shop won't have for a long time."

Rules for the day

Never say
"53%", "1.8x", "proven in Singapore", or "the small model beats the big one". Say 57%, about 1.9x, ranged 38–85%.

Never present
a recording as live. If the backup video plays, say "this is the recording".

If you blank
look at the slide's one line and say it in your own words. The numbers are on slides 3 and 9.

Before you start
slides on slide 1, notifications off, phone silent. Shareef and Thuta have reset Aisha.

From docs/Pitch_Plan.md (sections 2 and 6) and docs/Model_Technical_Notes.pdf · slide numbers match docs/Nudgely_Finals_Pitch.pptx (slide 5 is the hidden demo run sheet) · Kampung Fresh, Mei Ling, Hafiz and Aisha are fictional.
