Jack · AI and message quality
Update for the team · 11 Nov 2026

What I've built so far, and what needs you.

45 commits since 21 Oct across the AI, the model, the app and the docs. Most of it is already on `main`; the newest 9 commits are on `jack/next-phase`, waiting to be merged.

86% precision · 72% exactly right
`docs/TAGGING_ACCURACY.md`

57% vs 30%
Extra visits caught by top 30%
Model on 10 shop-computable features
About 1.9x random · ranged 38–85%

HACKATHON — 21–23 Oct

- **All 30 messages** generated, then hand-checked twice: fixed 5 that claimed things the chats don't support, and rewrote 26 for a respectful tone ending in a question.
- **Evidence verifier:** a message is flagged if it says something the chat doesn't back up. No draft is ever written for an opted-out customer.
- Fixed the Gemini client and the Windows crash in the LLM scripts.

THE AI ENGINE — 3–5 Nov

- **Reply bot:** answers a customer or hands to a person. A checker blocks invented prices or offers, and a blocked reply can never be sent by mistake. **HUMAN** always reaches a person.
- **Per-message tagging,** fast enough for a live webhook, measured on a 32-chat test set.
- **Template filling:** the 6 WhatsApp templates are filled by code. A blank the model invents is rejected, not patched.
- **Model fallback:** when one free model is rate-limited it moves to the next, without hanging.
- **A model a real shop can use:** retrained on 10 features computable from phone, date and amount. It lost no accuracy doing it (57% vs 44.8% for the 190-column one; the gap is within the noise).
- **Shop scorer** from a sales export, and a **daily job** that runs the whole pipeline unattended.
- Campaign **outcome logging** with the kept-back group, and `docs/JACK_WORK.md` explaining each piece.

THE APP — 6–8 Nov

- **Landing page** with sign-in and an "Explore the demo" door, plus the rotating 3D customer field.
- Sidebar and page layout: one job per page, sign out at the top, a clear message when a campaign runs.
- **Campaign plan** rewritten so a shop owner understands it, with the message list collapsible.
- Fixed the sign-in for the Streamlit version pinned on main.

THIS WEEK — 8–10 Nov · on jack/next-phase

- **How the model works** in plain English, plus an 11-slide deck: `docs/HOW_THE_MODEL_WORKS.md`.
- **One number everywhere:** the app, brief and PDF, submission draft, PRD and Responsible AI doc now say 57% (38–85%), not 53%.
- **Results page:** a labelled example campaign with an honest verdict and range, so the payoff is visible in the demo.
- **Record who came back** NEW Upload the shop's sales CSV or Excel. Messaged and kept-back customers are marked the same way, and an Excel report lists rows to fix and upload again. This replaces coupon codes, which would only exist for messaged people and inflate the result.
- **WhatsApp bot wiring** NEW Tagger and reply bot plugged into the webhook, with no double replies on Meta retries, STOP without the AI, and the bot quiet for 12 hours after a handover.

WHAT I NEED FROM THE TEAM

- **Thuta:** merge `jack/next-phase`. Your `nudgely/bot.py` and my `nudgely/conversation.py` do the same job, so keep yours and I'll move over any safety checks it's missing.
- **Thuta:** outcome tracking is the sales upload now, not coupons. Please update TEAM.md.
- **Dythan:** the landing page and deck should say **57%, about 1.9x, ranged 38–85%**, not 53% / 1.8x.
- **Everyone:** the bot sends customer messages to a free-tier AI. Fine for us testing; we need a paid key before real customers.
